

Container Water Purification Systems

When Shipping the Building *with* the Equipment Makes Sense

**Mobil - Plug and Play
A/C or Heated, Insulated
Single Point Electrical Drop
Overhead Lighting
External Plumbing Hookups**

**Limited Civil Work
Piped and Wired
Automated Operation
Multi-Container Solutions
Programmable Controls
Access Door on Side**

Brackish and Seawater Water Treatment

Configurable Water Purification systems in 20' or 40' shipping containers from Water Tech-Haliant are custom designed for any application or water problem. Each system is built based per specific customer requirements and manufactured in the USA.

Whether simple particle filtration, UF, RO, or other high purity water is required, design is limited only by what can actual physically fit in the container. We design based on customer water quality requirements and feed water analysis. Our application engineers run projections to determine appropriate treatment methods and develop the process flow diagram used to design the equipment.

Water Tech-Haliant work with specifying engineers and/or the customer to ensure complete satisfaction. Systems can be designed using our standard components or customer specified items. Each container is also built to withstand the environmental conditions of the installation site.

Systems are PLC controlled programmed with a variety of options. Equipment can be remotely monitored for flows, pressures, quality, and run/fault conditions to allow operators more flexibility. Internet connection systems can be monitored anywhere in the world.

In remote environments, multiple processing locations, or if you just don't have the space available for your water treatment needs, Call Water Tech and learn how we can help. You'll be surprised how economical this choice can be.
